

SYSTEM FOUNDRY / PERSONAL MVP

SetWise

A priority-based daily rehearsal queue for musicians with too many pieces and too little time.

01 / PROJECT OVERVIEW

Project overview

SetWise converts a musician's repertoire into a daily practice queue. It scores each piece by confidence, practice gap, and performance proximity, then fits the highest-priority work into the available minutes.

02 / TARGET CUSTOMER

Target customer

Music students, school and community band members, and hobby performers preparing several pieces at once without a structured daily practice plan.

03 / PROBLEM

Problem

Limited practice time is often spent on familiar material because deciding what to work on creates friction. Weak sections and upcoming performance deadlines can be overlooked until late in the preparation cycle.

PRODUCT

Three focused jobs

04 / CORE FEATURES

Core features

The MVP implements one complete planning loop:

01	Validated repertoire intake Title, focus section, confidence, recommended minutes, and optional performance date.
02	Priority-based daily queue Confidence need, days since practice, and deadline urgency combine into a transparent score.
03	Practice completion history A finished session updates confidence, last-practiced date, and weekly minutes.

05 / HOW TO USE

How to use

Set today's available minutes, review the generated queue, practice the specified focus section, select post-session confidence, and mark the session complete. Add new repertoire from the side panel as needed.

06 / SYSTEM ARCHITECTURE

System architecture

A static browser application loads pure planning functions, renders the interface, and persists the repertoire and recent session history in localStorage. There is no server-side account or database.

Browser UI	Planner module	Local storage	Node tests
HTML + CSS	Scoring + validation	Device-only data	Pure functions

07 / TECHNOLOGY

Technology

Static HTML, responsive CSS, vanilla JavaScript, localStorage, and the built-in Node.js test runner. Runtime dependency count: zero. Paid API count: zero.

VALIDATED INTERFACE

Actual running screen

Captured from headless Chromium after the application calculated the default repertoire queue.

08 / RUNNING SCREEN

Running screen

The verified screen shows four repertoire items, two performances within 14 days, 32 minutes practiced this week, and a 33-minute queue ordered Bach Prelude, Scale Routine, and Open Ending. Completing the first session increased the weekly total to 47 minutes.

VERIFICATION

Evidence, not assumptions

09 / TEST RESULTS

Test results

All required checks were executed against the generated project.

Check	Result	Evidence
Dependency installation	PASS	npm install completed; zero runtime dependencies
Application start	PASS	Local HTTP server returned status 200
Core calculation	PASS	Queue order, 33-minute plan, and summary totals asserted
Completion workflow	PASS	Weekly minutes changed from 32 to 47
Automated tests	8 / 8	Validation, scoring, budget, history, summary
README commands	PASS	Install, test, and start commands executed
Credential scan	PASS	No secret patterns and no .env file
PDF	PASS	Generated, parsed, rendered, visually inspected

10 / SECURITY AND LIMITATIONS

Security and limitations

SetWise sends no data to external services and collects no account or identity information. Inputs are length-, type-, date-, and range-validated. Rendered user text is HTML-escaped. No credentials are required. Limitations: browser-local data can be lost when storage is cleared, there is no device sync, and the priority formula is a planning aid rather than a skill assessment.

GO TO MARKET

A small paid utility

11 / PRICING AND REVENUE MODEL

Pricing and revenue model

One-time purchase at KRW 12,000 for the downloadable local-first version. A later optional sync tier could charge KRW 2,900 per month, but the MVP does not require hosting or paid services.

12 / FIRST CUSTOMER ACQUISITION

First customer acquisition

Recruit the first ten users from school music clubs, independent lesson studios, and Korean instrument communities. Offer a seven-day trial and ask each user to compare decision time and missed focus sections against their current notebook routine. Convert with a simple message: open the page and know what to practice first.

13 / IMPROVEMENT PLAN

Improvement plan

Priorities after observing real practice sessions:

- JSON backup and restore for device migration.
- Multiple instruments and teacher-shared assignments.
- Optional metronome targets and section-level notes.
- Private encrypted sync only after users request cross-device access.

COMMERCIAL ASSUMPTION

SetWise should remain a decision tool, not grow into a full digital audio workstation or sheet-music platform. The narrow value is reducing daily planning friction.

ASSESSMENT

Overall evaluation

14 / OVERALL SCORE

Overall score

Six dimensions are scored out of 10. A higher maintenance score means easier maintenance.

Dimension	Score	Rationale
Customer problem strength	7/10	Daily practice prioritization is recurring, though not financially urgent.
One-day completeness	9/10	The full planning and completion loop is implemented and browser-tested.
Sales potential	7/10	Low price and a focused audience support direct sales; interviews remain necessary.
Maintenance difficulty	9/10	Zero runtime dependencies and no backend keep maintenance light.
Differentiation	8/10	Transparent time-fitting priority queues are sharper than generic practice logs.
Scalability	8/10	Teacher assignments, instruments, and optional sync create expansion paths.

OVERALL

8.0 / 10

Proceed to a ten-user trial and measure planning time saved.

Verdict: technically complete and visually polished for a personal MVP. The next useful evidence is whether musicians repeatedly open it before practice and follow the generated queue.
